

Fall armyworm

The REAL pocket-sized monster

The fall armyworm is a new pest attacking maize in Africa.

The eggs and caterpillar are easiest to spot on the leaves and growing point of your maize. You can tell when a caterpillar is a fall armyworm by the 4 dots on its second to last segment and the upside down Y on its head.

Its lifecycle includes eggs which hatch into caterpillars that grow to become pupae, from which a moth emerges. Each and every stage is bad for your maize.

See it. Squash it. Stop it.
