5-YEAR REVIEW
Short Form Summary*

Species Reviewed: Phyllostegia waimeae (No common name)
Current Classification: Endangered

FR Notice announcing initiation of this review:

Lead Region/Field Office:
Region 1, Sarah Hall, Chief, Division of Recovery, (503) 231-2071

Pacific Islands Fish and Wildlife Office, Gina Shultz, Assistant Field Supervisor for Endangered Species, (808) 792-9400

Name of Reviewer(s):
Christian Torres-Santana, Pacific Islands Fish and Wildlife Office, Fish and Wildlife Biologist, (808) 792-9400
Marie Bruegmann, Pacific Islands Fish and Wildlife Office, Plant Recovery Coordinator, (808) 792-9400
Marilet A. Zablan, Pacific Islands Fish and Wildlife Office, Recovery Program Leader and Acting Assistant Field Supervisor for Endangered Species, (808) 792-9400

Methodology used to complete this 5-year review:
This review was based on the final critical habitat designation for Phyllostegia waimeae and other species from the island of Kauai. The National Tropical Botanical Garden provided the updated information on the current status of Phyllostegia waimeae.

Application of the 1996 Distinct Population Segment (DPS) Policy:
Not applicable.

Review Analysis:
Please refer to the final critical habitat designation for Phyllostegia waimeae published in the Federal Register on February 27, 2003 (68 FR 9116) for a complete five-factor analysis and a discussion of the species’ status (including biology and habitat), threats, and management efforts. No significant new information regarding the species’ biological status has come to light since this listing to warrant a change in the Federal listing status of P. waimeae.

Phyllostegia waimeae is currently known to occur in two locations on Kauai. Two individuals were found at Kawaiiki in 2000, on State Forest Reserve land. Eight mature individuals and 20 seedlings were observed during subsequent surveys in June 2001 (Perlman 2006). Feral pig sign was observed in the area and a number of plants had been

This short form is to be used ONLY when there is no new information, or when the 5-year review is being done concurrent with another range-wide status review (such as a 12-month finding on a delisting petition) that completely addresses all the questions outlined in the standard 5-year review template. Attach a copy of the final 12-month finding or other status review to this form.
uprooted (Wood 2006). Four plants were seen in 2002, but botanists were not able to relocate them during subsequent site visits in 2005 or 2006. However, it is likely that some plants are still in the area, as suitable habitat remains (S. Perlman, National Tropical Botanical Garden, pers. comm. 2006). The second location is in the Koie drainage above Twin Falls, where two individuals were observed in September 2001. The historical location in Waimea Canyon, where *P. waimeae* was last seen in 1969, has been searched several times, but no plants have been found. The area is now very weedy and has many goats. Additionally, the last two hurricanes opened many gaps in the canopy, which were filled by *Lantana camara* (lantana), a particularly invasive plant species (Perlman 2006). *Phyllostegia waimeae* seems to grow best at higher elevations and associated cooler temperatures (R. Nishek, pers. comm. 2006).

Major threats to *P. waimeae* include feral pigs (*Sus scrofa*) and goats (*Capra hircus*) uprooting plants and causing habitat degradation and erosion (Factors A, D, and E); rats (*Rattus* spp.) eating leaves and seeds (Factor C); over-collecting for scientific purposes (Factor B); habitat degradation by invasive introduced plant species such as *Grevillea robusta* (silk oak), *Morella faya* (firetree), *Rubus argutus* (prickly Florida blackberry), *Psidium cattleianum* (strawberry guava), and *Lantana camara* (lantana) that compete with and degrade habitat of *P. waimeae* (Factor E); and the risk of extinction from stochastic events and reduced reproductive vigor due to the small number of individuals (Factor E) (68 FR 9116; Perlman 2006; Wood 2006). In the nursery, *P. waimeae* is attacked by spider mites, mealy bugs, *Phytophthora* fungus and mildew (Factor C) (R. Nishek, National Tropical Botanical Garden, pers. comm. 2006).

The Hawaii Division of Forestry and Wildlife has outplanted 60 individuals at their exclosure at Kalalau Rim for ex situ genetic storage (Hawaii Division of Forestry and Wildlife, Kauai 2006). The National Tropical Botanical Garden currently has 59 plants in the nursery, grown from cuttings. The Hawaii Division of Forestry and Wildlife, Kauai, has seeds in storage and 20 plants in controlled propagation (National Tropical Botanical Garden 2006; Hawaii Division of Forestry and Wildlife, Kauai 2006). It is a relatively short-lived plant, which may need to be replaced once outplanted, if it does not reproduce within its short lifespan. Although grown relatively easily from cuttings, in the nursery *P. waimeae* is attacked by spider mites, mealy bugs, *Phytophthora* and mildew (R. Nishek, pers. comm. 2006).

Stabilizing, downlisting, and delisting objectives are provided in the recovery plan for Kauai plants (USFWS 1995), based on whether the species is an annual, a short-lived perennial (fewer than 10 years), or a long-lived perennial. *Phyllostegia waimeae* is a short-lived perennial, and to be considered stable, the taxon must be managed to control threats (e.g., fenced) and be represented in an ex situ (off-site) collection. In addition, a minimum of three populations should be documented on Oahu. Each of these populations must be naturally reproducing and increasing in number, with a minimum of 50 mature individuals per population.
The stabilization goals for this species have not been met (see Table 1). Therefore, *Phyllostegia waimeae* meets the definition of endangered as it remains in danger of extinction throughout its range.

**Recommendations for Future Actions:**

- Increase the number of individuals in cultivation and genetic storage through controlled propagation.

- Survey for populations in suitable habitat within historical sites.

- Augment populations as plants become available in nurseries and habitat is protected.

- Reintroduce populations in areas of suitable habitat that can be protected from goats and other ungulates, rats, and human disturbance.

- Fence remaining populations and control ungulates to maintain the remaining populations.

- Control introduced invasive plant species around the remaining populations.

- Study new or reintroduced *Phyllostegia waimeae* populations with regard to population size and structure, geographical distribution, flowering cycles, pollination vectors, seed dispersal agents, longevity, specific environmental requirements, limiting factors, and threats.

Pre-1996 DPS listing still considered a listable entity? N/A

Recommendation resulting from the 5-year review:

_______ Delisting
_______ Reclassify from Endangered to Threatened status
_______ Reclassify from Threatened to Endangered status
X No Change in listing status
