# **Supplementary Appendix 6.1b. Species Incidences on Offshore Islands: Discriminant Function Analyses**

---

## **Basic Results**

Discriminant function analysis of butterfly species for 191 islands having two or more of three migrant species (*Colias croceus*, *Vanessa cardui*, *V. atalanta*).

Equal *a priori* classification applied as there is no inherent reason why inclusion should be affected by the balance of incidences on or absences from islands.

Variables entered in forwards stepwise mode include:

- F1: island isolation (I1) and satellites (SAT);
- F2: island area (A) and maximum elevation (ELEV);
- F3: longitude (LONG);
- F4: island isolation (I2);
- F5: latitude (LAT).

The second is based on one of two contributory source variables:

- FS1: number of 10 km square records within 50 km of the nearest mainland source;
- FS2: number of 10 km square records within 50 km of the nearest larger source, island or mainland).

Variables not in tables were eliminated.

*See Supplementary Appendix 6.2 (part 3) for discriminant function predictions of species for islands.*

*Thymelicus sylvestris*
